Test Comments: This test site was planted early, during the first couple of days that area farmers started planting. Seedling emergence was excellent across the entire location. This growing season was almost ideal. Late season conditions favored development of Northern corn leaf blight, gray leaf spot, common rust, and spotty areas with Diplodia ear rot. Overall, this was a nice uniform corn on corn location.

† See last page for abbreviation descriptions. Dark colored row identifies the check product found in early- and full-season tests. **Bold** yields are significantly above test average by LSD(0.10). **Italicized** brands exceed the grain moisture limit for this test. **ns** = column values not significantly different
