TEST COMMENTS: *Amazing what late season rain can do for a bean crop, struggling through dry conditions into much of July. Pods per node were few. However, seed size was large and gave yields a little boost. Through the season, 4" came during vegetative stages, 1.2" from bloom to full pod and 10.1" from beginning seed to maturity. Rainfall totals, planting to R6, ended about 6" below the area 30-yr average.*

† See last page for abbreviation descriptions. Results in **bold** are significantly above test average by LSD (0.10). **ns** = column values not significantly different.
